Dear Alpacked team,

I'm writing about the Senior Azure Platform / AI Engineer role. One thing I want to be upfront about: Alpacked's core business is Kubernetes/DevOps-as-a-service, and my Kubernetes depth doesn't match what a role built on that foundation would need — I'm solid on Docker, Terraform, and CI/CD, and have deployed to Azure-hosted infrastructure in production, but I haven't personally owned Kubernetes cluster architecture. If this role leans heavily on the K8s/DevOps side rather than the AI/ML layer you're building out, it's probably not a fit, and better to know that now.

Where I do think I'm a strong fit — the AI/ML layer. As the lead engineer (through my company, as the contracting entity) on a multi-tenant AI agent platform for a German AI SaaS company, I built and hosted the whole thing on Azure: a Python/FastAPI backend for dynamic agents (tool registries, tenant-safe execution) alongside a NestJS/React/PostgreSQL customer-facing layer with row-level security for tenant isolation. I was the top contributor (~45%) across both core repositories and owned the staging-to-production release flow.

Why I think about this the way you do. Building AI Agent Infrastructure (10k+ reads) covers the same evolution from ad-hoc tool wiring to a proper agent-factory pattern that an "LLM deployment / MLOps" practice eventually needs. Google ADK and "Startup Technical Guide: AI Agents" covers AgentOps and security guardrails for production agents.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

If the Kubernetes gap above rules this out, I'd rather hear that directly. If the role is more AI/ML-layer focused, I'd welcome the chance to talk through it in more depth.

Best regards,

Mykhailo Kapustin
