Dear Devcom team,

I'm writing about the Middle/Senior Full Stack Developer (Node.js/TypeScript) role. Building the AI layer over a patient's full journey through functional medicine is a good problem — structured, high-stakes data that needs to be handled carefully, not just another CRUD app.

Why this role fits. As the lead engineer (through my company, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I built the full Node.js/TypeScript stack: a NestJS/React/PostgreSQL customer-facing layer with row-level security for tenant isolation, agents deployed across web chat, email, and Outlook. I was the top contributor (~45%) across both core repositories and owned the release process from staging to production.

Why I think about this the way you do. Building a Resume Matcher with tRPC, NLP, and Vertex AI (24k+ reads) covers getting structured, predictable output from an LLM over unstructured documents — the same class of problem as turning a patient's data into a structured journey rather than free text.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through how deep the AI/agent layer actually goes on this specific client project.

Best regards,

Mykhailo Kapustin
