Dear GlobalLogic team,

I'm writing about the AI Engineer (Generative AI, Agentic Workflows) role. Decentralizing patient care at home for a US medical company is a meaningful problem, and it's the kind of agentic-workflow work I've been doing for the last couple of years.

Why this role fits. As the lead engineer (through my company, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I built the Python/FastAPI backend for dynamic agents — tool registries, tenant-safe execution, agentic workflows — alongside a NestJS/React/PostgreSQL customer-facing layer with row-level security for tenant isolation, running production agents on Gemini and Claude across web chat, email, and Outlook. I was the top contributor (~45%) across both core repositories and owned the release process from staging to production.

Why I think about this the way you do. [Google ADK](#) and "[Startup Technical Guide: AI Agents](#)" covers grounding, AgentOps, and security guardrails for agentic workflows in production. [Building AI Agent Infrastructure](#) covers scaling agent infrastructure from ad-hoc tool wiring to a proper AgentOps layer.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through the client project in more depth, and to understand how the role is structured relative to the broader engagement.

Best regards,

Mykhailo Kapustin
