---

Dear Seeking Alpha team,

I'm writing about the Senior Python AI Engineer (LLM/Multi-Agent Systems) role. Turning unstructured text and data into a structured, auditable signal — the way Quant Ratings does with financial data — is a class of problem I've spent real time on, so I wanted to reach out.

**Why this role fits.** Building an App Store Review Analysis Pipeline is probably the clearest example: a modular Python pipeline that turns raw app reviews into a severity-scored, auditable signal — sentiment analysis with a hybrid scoring formula, TF-IDF keyword extraction, and a deliberate choice of a deterministic pipeline over an end-to-end AI agent, specifically because deterministic design gives consistent, auditable results. That's the same underlying discipline Quant Ratings needs: reproducible, defensible output, not a black box. Separately, as the lead engineer (through my company, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I built the Python/FastAPI backend for dynamic agents and owned the release process from staging to production, and I've run LangChain/LangGraph in production for close to 3 years, including on a forecasting platform aggregating multi-source signals for social, economic, and geopolitical events.

**Practical note.** I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through how Python-centric this specific role is in practice, and to hear more about how the multi-agent side of the system works today.

Best regards,

Mykhailo Kapustin
