Dear 6037 team,

I'm writing about the Senior Backend Engineer role on Creative Factory. Building the backbone behind a consumer-scale content engine is a specific kind of problem — reliability and multi-tenancy at scale matter more than any single clever feature — and it's what I've spent the last two years doing.

Why this role fits. As the lead engineer (through my company, as the contracting entity) on a multi-tenant SaaS platform for a German AI company, I built the NestJS/PostgreSQL backend with row-level security (FORCE RLS) enforced at the database level for tenant isolation at scale, plus a Python/FastAPI service for dynamic agents and tool registries. I was the top contributor (~45%) across both core repositories and owned the staging-to-production release process — including the boring but critical part: making sure a release doesn't break isolation between tenants under load. Before that, I spent three years as a backend/full-stack developer across companies where reliability under real traffic, not just feature velocity, was the actual job.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through the architecture in more depth, and to understand how much of Creative Factory's pipeline is LLM/agent-driven today versus rule-based.

Best regards,

Mykhailo Kapustin
