Dear Bina School team,

I'm writing about the RnD Developer - AI Product Developer role. Building a full-day, live-class online school that actually scales globally is a hard product problem, and it's a domain I have direct experience in.

Why this role fits. At my own research holding, I built and grew an EdTech platform from scratch on Vue/Nuxt, including an AI-driven content pipeline — the same kind of product-and-content problem "AI literacy" and adaptive learning tend to run into at scale. Separately, as the lead engineer (through my company, as the contracting entity) on a multi-tenant AI agent platform for a German AI SaaS company, I built the Python/FastAPI backend for dynamic agents — tool registries, tenant-safe execution — with natural-language agent authoring, and was the top contributor (~45%) across both core repositories.

Why I think about this the way you do. My Personal Exam: MVP LLM Agent on Google ADK covers multi-agent architecture patterns built in an educational-assessment context — reviewer-agent validation before an answer goes out, which matters a lot when the product is talking to kids.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through what "AI Product Developer" means technically here — which part of the stack it touches, and whether the "bina as a Service" direction is already underway or still ahead.

Best regards,

Mykhailo Kapustin
