Dear Datagrok team,

I'm writing about the Engineering Manager role. Turning scientific data — cheminformatics, macromolecules — into something a browser can query at scale is a genuinely interesting problem, closer to the graph-based knowledge work I've spent time on than typical enterprise data tooling.

One thing worth clarifying up front. "Engineering Manager" can mean different things — people management as the primary function, or a hybrid of tech lead and management. My formal people-management experience is real but limited to one title (Team Lead, MOB.325) plus building and growing my own engineering team from zero as Co-Founder & CTO. If this role is primarily about managing a team of 20 day to day, I'd want to talk through what that looks like in practice before assuming I'm the right fit.

Where I do think I'm a strong fit. Docling in Working with Texts, Languages, and Knowledge — written while building a scientific-journal platform — covers representing scientific documents as graphs of typed, linked nodes rather than flat text, conceptually close to what a platform like Datagrok needs for cheminformatics and macromolecule data. As the lead engineer (through my company, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I also built and owned a production system end to end, including the release process from staging to production.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through what the role actually looks like day to day, and how the team splits between platform engineering and domain-specific (cheminformatics) work.

Best regards,

Mykhailo Kapustin
