Dear Empat team,

I'm writing about the Senior Full-Stack Developer (AI-Native) role. "Thinking partner, not executor" is a good description of the role I've been playing for the last couple of years, so I wanted to reach out.

Why this role fits. As the lead engineer (through ASRP, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I owned the whole slice as one person — NestJS/PostgreSQL backend (row-level security for tenant isolation), React frontend, and the Python agent-authoring layer that lets someone describe an agent in plain text and get a working, deployed one back in about a minute. I was the top contributor (~45%) across both core repositories and owned the release process from staging to production. That's the model I understand "AI-native full-stack" to mean: one person across backend, frontend, and the agent layer, not three separate roles handed off between people.

Why I think about this the way you do. My Personal Exam: MVP LLM Agent on Google ADK is a fairly direct reflection of that shift — from writing code to owning architecture, hiring, and delegation, not staying purely an implementer. Building a Resume Matcher with tRPC, NLP, and Vertex AI (24k+ reads) is an open-source full-stack + AI build with an honest look at where the chosen stack falls short, rather than a polished sales pitch.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through which client format this role sits closest to — Fixed-Scope MVP, a longer engagement, or something closer to CTO-as-a-Service.

Best regards,

Mykhailo Kapustin
