Dear Sigma Software team,

I'm writing about the Forward AI Deployment Engineer role. "Agent factories, tool registries, multi-tenant runtime" is close to a literal description of a platform I've already built, so I wanted to reach out directly.

Why this role fits. As the lead engineer (through ASRP, as the contracting entity) on a multi-tenant agent platform for a German AI SaaS company, I designed it around exactly that pattern: scoped agents spun up against a shared tool registry, multi-tenant from day one (NestJS/React/PostgreSQL, row-level security for tenant isolation). I was the top contributor (~45%) across both core repositories and owned the release process from staging to production. Beyond that platform, I built and deployed a voice agent for a US logistics company directly to real users — a self-healing cloud-PBX integration handling live call state under real network conditions, not a controlled demo — which is the same "forward deployed, not just architected" experience the FDE role is built around.

Why I think about this the way you do. Building AI Agent Infrastructure (10k+ reads) covers exactly the factory/registry pattern the role calls for — a real client case, not a hypothetical. Google ADK and "Startup Technical Guide: AI Agents" covers AgentOps testing and guardrails, which sounds close to what AI Compass's ISO 42001/EU AI Act work is aiming for.

Practical note. I hold EU citizenship and am based in Berlin. I'm open to full-time, contract, or freelance arrangements — whatever fits how you're structuring the hire.

I'd welcome the chance to talk through how this role splits between internal AI Compass work and client-facing deployment.

Best regards,

Mykhailo Kapustin
